I have to check a lot of parameters to do the conversion to go from the data received from the hardware to what I want to do. I was thinking of storing all these in a struct, but I'm not sure if it's the best option. One possibility is that I create a static array with the structs and then create new instances each time a function need to do the conversion. Or just create a global array and use it. Which way is more reliable? A: If the number

of structs is fixed, then use a static array. If the number is not fixed, then create new instances each time is a better option.

$(p + 1)^{3/9}$ Factor $\frac{1}{2}f^2 - 4f + 0$. $f(f - 8)/2$ Let a be $(-9)/6 * (-12)/27$. Let $b(c)$ be the first derivative of $-2 + 0c^4 + 0c + 0c^2 + 2/15c^5 + ac^3$. Factor $b(j)$. $2j^2(j - 1)(j + 1)/3$ Let $g(l)$ be the third derivative of $l^{5/120} - l^{4/12} + l^{3/4} + 7l^2$. Determine x , given that $g(x) = 0$. 1, 3 Factor $21/2x^3 - 3/4x$
