Harper, who has spent the last two decades studying the impact of the environment on the brain, learning and behavior. He has devoted his career to the notion that the environment shapes the brain, and that a craving for an addictive substance like heroin is actually a reflection of a brain that is not mature, not wired for self-control, so it demands something in its place that it can't give. Through a growing literature, many of the most common recreational drugs like alcohol, nicotine and cannabis can be understood as toxic challenges to the brain's physiology, and drugs that destroy these challenges are often a source of pleasure. Dr. Harper describes addiction as a medical disease, not a moral failure or a character flaw. His studies on the opioid crisis, and his patient-centered approach to treatment, are shaking up the established thinking about addiction. He is now offering a method for treating addiction that takes the disease seriously. "When I started, people treated addiction as if it were a moral, character flaw or an addiction to 'the wrong thing,' like marijuana," said Harper. "But the way in which we look at it is
