Plasminogen: a target for antibody-mediated therapy. In vitro studies have shown that plasminogen can act as an inhibitor of plasmin production by mammalian cells, and that anti-plasminogen antibodies can increase the activity of plasmin and that the increased plasmin production then facilitates the clearance of extracellular plasminogen activators. In animals that have been treated with anti-plasminogen antibodies, plasmin is accumulated in both blood and tissues, resulting in a systemic effect. In fact, in animals that have been passively immunized with the anti-plasminogen antibody, the level of extracellular plasminogen activators is reduced, demonstrating that extracellular plasminogen is removed from the circulation. In addition, when the mice are treated with an inhibitor of plasmin, the amount of anti-plasminogen antibody binding to the cell surface is increased and the systemic effect is more pronounced. These results indicate that plasminogen is a target of anti-plasminogen antibodies and that the antibody can be used as a probe to evaluate the nature of the plasminogen receptor. This probe has been used to isolate and characterize the plasminogen receptor on human fibroblasts. These results suggest that the plasminogen receptor is similar to the interleukin-2 receptor, which is composed of a ligand-binding subunit and a signal transducing subunit. The process by which the plasminogen receptor is activated and the role that the activation process plays in the induction of cell death in some cell types are currently being investigated. The results obtained to date indicate that plasminogen can act as a growth factor, and that the interaction between plasminogen and cell surface receptors plays a role in the regulation of cell proliferation. The fact that plasminogen binds to cell surface receptors in vitro and that the anti-plasminogen antibodies inhibit plasminogen binding in vivo suggests that the physiological function of the plasminogen receptor might be similar to that of the interleukin-2 receptor. Further studies should allow us to clarify the role

Former UFC Lightweight Champion Benson Henderson is believed to be nearing his retirement from the sport and the company has already made preparations for his departure. Henderson suffered a shocking TKO loss at UFC 164 when he was stopped by Anthony Pettis in the third round. After the fight, Henderson told MMAJunkie.com he was "leaving the sport" and a source with knowledge of the situation confirmed the comments to MMA Fighting. While Henderson was able to make a statement in a tough fight against Pettis, his future is uncertain and the UFC will soon start looking for his replacement. A free agent after the fight, Henderson (16-2) has been linked to a number of options on the open market. According to a report from MMAWeekly.com, the former champion has agreed to sign with Bellator. A deal could be signed at any time and Henderson is expected to compete at Bellator 131 in September. The source also told MMAFighting.com that former light heavyweight champion Quinton Jackson (31-6-1) will be one of his first opponents if he signs with Bellator. With some of the top names in the UFC already off the market and a vacancy on the roster, Henderson could be one of the first free agents signed by Bellator.Q: How to use $.Deferred() in jQuery? I have the following code $.getJSON('services.php',function(data){ var service = data.services[0]; var price = service.price; var tax = service.tax; var total = price * (1 + tax); var output = "Customs: " + service.customs + " " + "Sec. Inspection: " + service.sec_inspection + " " + "FO 2d92ce491b
