References External links South Africa is based on the *K*-d- of its RNA target, and (**b**) the x-ray structure of C. albicans PNP1 (PDB id 3U2Z; residues 23-315, with the β -1- β -2- hairpin removed and replaced by a linker, see [Figure 6](#gkt1018-F6)(ref-type="fig")b for residues involved) docked with its RNA substrate. The structural elements from each molecule are coloured as follows: protein, red; RNA, yellow; and water molecules, blue. Black dashes indicate protein-protein and protein-RNA hydrogen bonds. Protein-RNA docking ----- The side chains of Ser107 and Arg112 of C. albicans PNP1 are within hydrogen-bonding distance of a Watson-Crick base pair in the RNA, suggesting that they may be docked on the target strand ([Figure 7](#gkt1018-F7)(ref-type="fig")b). Interestingly, a series of conserved Arg and Lys residues (in addition to Arg112, Arg126 and Lys130) in C. albicans PNP1 are predicted to contact the target region of the RNA, thus making possible multiple interactions with the target strand. The predicted tertiary structure of C. albicans PNP1 is supported by x-ray crystallography of the complex between PNP1 and its RNA substrate, which reveals that a single molecule of RNA 2d92cc491b
