Q: Django ModelForm Won't Save Changes When Changed on HTML Form I am trying to make the data from my web page on the website be saved into a database (unless changed). I have some models on my website to store the data with the user, but I also have one called Profile that will save it to a database table called Profile, from a web form on that page that has a form with fields of Name, Age, and Grade for the user to input, and in the Profile save method I have user = request.user.user.username, age = request.POST['age'], grade = request.POST['grade'] to be put into the Profile table. If I do this: from django import forms from django.forms import modelform from.models import Profile class EditUserForm(forms.Form): name = forms.CharField(max_length=50) age = forms.CharField(max_length=10) grade = forms.CharField(max_length=5) def save(self, user): Profile.objects.filter(user=user).update(user=self.cleaned_data['user']) class Meta: model = User fields = ['name', 'age', 'grade'] And this: from django import forms from django.forms import modelform from.models import Profile class EditUserForm(forms.ModelForm): def save(self, user):

Profile.objects.filter(user=user).update(user=self.cleaned_data['user']) class Meta: model = User fields = ['name','age','grade'] and run a shell and do the above, d4474df7b8
