It uses samples as a base, which can be processed in many ways with different effects, to create a track. This is useful for ambient music, sample-based electronic and ambient trance music genres. It can be very easy to use, but it can also be very complex. The workflow for creating a new track is the following: Select an instrument that will be used to process a sample. The selection window has three tabs:

- Samples: select samples you want to use in the track
- Instruments: open the instrument's window
- Chords: view chords associated with selected samples

Chords/Instruments: view chords in the chords/instruments window If you're the first user of the instrument, you can select any sample as a starting point. But, if you're experienced, you can add chords/samples that will be used to process the selected sample. Click "OK" to start a new track. You will be asked to add a title, and a set of samples to your track. In the "Samples" tab, you can select samples, add loops or add the master track. You can start with the

master track by pressing the "Add" button. The
