This guide will walk you through every single feature of Photoshop Elements. Your first few times working in Photoshop Elements, you may feel a bit overwhelmed. It's the same with any version of Photoshop, but the default image size is more forgiving in Elements. You may also have a smaller library of photos available for editing. I'll try to point out the most helpful features of the software with the least amount of time-consuming thinking. Preliminaries If you have used a free version of Photoshop, you already have the basics, such as the palette, layers, and tools. The default sizes and settings make it easy to edit images in Elements. In my opinion, the most important thing is to study a basic tutorial on the software. You can find a collection of free online tutorials on the Adobe site. Next, try to update or download the software. It only takes a couple minutes of your time. You may also need to create an Adobe ID and sign up to the Creative Cloud in order to use Photoshop Elements. Basic features Before I start introducing tools, it's important to make sure you understand how to use the entire program, including the extensions that are not covered by this tutorial. You can buy a book or join a training session to learn all the features and functions of Elements. Start by opening a new document. Create a 1200 x 880 pixel image. You can easily resize it in the Options palette, where you can also change its color, resolution and format. For now, we're simply going to make copies of the image. This will be the basis for all the following images. We're going to make six copies of the original and rename them accordingly. This will also give us more space for our adjustments and effects. We'll start by creating a new layer on top of the background. Then, we'll duplicate the layer and then rotate it. Change the name of the layer to "Cliff" and then resize it. This gives us a landscape with a very large cliff on one side. Click the lock icon in the Layers palette to open the Layers panel. Click the New Layer button. Resize the new layer to 10% of the width and 20% of the height and make sure the "Use default" checkbox is ticked. 05a79cecff

Programming A Space Shooter With Robotron – Part 2 Programming A Space Shooter With Robotron By Ed Treloar Concept-1 Since we had a basic idea of the programming, the next step was to learn the basics and build the game. The first thing I did was to look for a good starting point. I started with the game play and made it so that the players would put a shield around their ship and it would randomly shoot other players. In the following development, I would start at the movement of the player and progress up to the creation of the game as a whole. PixMaker – Basic Graphics To create the game, I used PixMaker. As a good free graphic program, it had all the basic functions. It had all the usual graphics tools, but with a comprehensive keyboard shortcut system. You could easily create beautiful graphics with a simple point and click, and then find out how you could improve it with other tools. But I didn't want the graphics to look "pretty". I wanted to create a game where players would be so immersed in the game that the graphics were just a background. And so I used the graphics tools to create the graphics of the ship and other objects. Game Canvas To create the game, I used the option called "Canvas". I wanted the players to be able to see their whole ship, which in my imagination, would be flying through space. I also wanted the player to be able to see other players, as I knew this was important for the game. In my imagination, I wanted the game to take place in a space similar to the Matrix, with the players looking through the eyes of their ships. So I wanted to create a wide, open space with a glowing space station in the background. The Spaceship The first thing I did was to create the base of the spaceship, which would be the main character. I used the basic and powerful "Solid" tool in PixMaker. I created some basic shapes, which I used as the basis for the spaceship. The next thing I did was to add some detail. I used a few different tools to add some detail to the character and to "fill in" some of the bigger shapes. I created some additional shapes and then created some basic sprite versions. I was using PixMaker for the sprites, but they
