The sarcoplasmic reticulum (SR) calcium-ATPase (SERCA1a) is an integral membrane protein composed of a hexamer of 145-kDa catalytic subunits plus a tight-fitting 65-kDa regulatory subunit (SR alpha) that tethers the enzyme to SR membranes. We generated four double-subunit constructs from the wild-type and mutated Ca(2+)-ATPase sequence that, in combination, result in the complete restoration of the Ca(2+)-ATPase activity of the SR homogenate. In each construct, the catalytic subunits are connected via either three different linkers, or via both the regulatory and catalytic subunits. This eliminates the contribution of the regulatory subunit to SR Ca(2+)-ATPase function; however, it allows us to determine how the Ca(2+)-ATPase

Further, though the eight-pole surface of the cap is loaded with a voltage which is the same as the input voltage of the detector, the detector senses an input voltage which is equal to the sum of that loaded voltage and the input voltage of the detector. Thus, the input voltage is increased and a first detection output will become an excessive detection output. Accordingly, it is difficult to make the detection sensitivity with respect to voltage lowered to a predetermined value.

Mortality and morbidity after open distal pancreatectomy: a systematic review. Surgical management of patients with pancreatic or distal bile duct cancer has changed dramatically over the last two decades. Despite the introduction of minimally invasive techniques, the majority of patients still undergo an open distal pancreatectomy (ODP). The aim of this review is to critically appraise the published series on ODP, in terms of mortality, morbidity, hospital stay and quality of life. A systematic literature search of the MEDLINE, EMBASE, Cochrane Library and CINAHL databases from 1989 to 2009, without language restrictions, was undertaken. Studies were eligible for inclusion if they reported series of at least 10 patients who underwent ODP for malignant or benign disease. A consensus conference was held to reach a final decision, based on non-weighted predefined criteria. A total of 55 studies were found to be eligible for inclusion, including 17 retrospective and 38 prospective studies. ODP was associated with increased mortality, depending on the definition of morbidity. The number of infections was the most consistently reported complication. ODP is associated with a significant increase in hospital stay, and although the quality of life is significantly better than after pancreatectomy by enucleation or duodenum preserving resection, it does not differ significantly from the results of pancreatoduodenectomy. ODP is the operation of choice for the treatment of distal pancreatic or bile duct cancer. Mortality and morbidity can be minimized by careful patient selection, meticulous surgical technique and a standardized postoperative care program.

Q: Is there a more meaningful name for the phrase "power over people"? I was reading an article about the common usage of the phrase power over people. I was curious if there were other expressions that might be used to describe the same concept. A: 648931e174

The Call of the Baraglaya: An Epic about a Merchant in Bicol The Philippine Epic Movement Free Essays on Philippines Literature Philippine Literature ADVERTISEMENT Social Discovering the world through literature makes things much easier for readers. They get to experience the life of people who are not physically present with them. It gives them the chance of exploring the culture, the society, the history, the social structure, and the patterns they live in. In addition to that, it allows them to gain a comprehensive understanding of a book and its characters.1. Field of the Invention This invention relates to the bonding of and to the extension of the solder connections between the pressure-sensitive pads of a pressure-sensitive device such as a flexible membrane print head and a head substrate, and more particularly to a coating for such solder connections. 2. Description of the Prior Art Pressure-sensitive devices as disclosed in, for example, U.S. Pat. Nos. 4,306,801 and 4,744,737, are used in the fabrication of pressure-sensitive devices such as ink jet printers. In the manufacture of the devices, a head substrate is provided, on which there are positioned pressure-sensitive pads. A flexing layer is then formed over the pressure-sensitive pads and is aligned therewith. The flexing layer is a continuous flexible film which is laminated to the pressure-sensitive pads and to the substrate at the periphery of the pressure-sensitive pads such that when a force is applied to the pressure-sensitive pads, the flexible layer will bend in the direction of the force. The substrate and the layer form a head assembly. The head assembly is then laminated to a member which is part of a printing cartridge. The printing cartridge is then moved so that the flexing layer of the head assembly presses the pressure-sensitive pads against the printing element of the printing cartridge. The pressure-sensitive pads are connected to the printing element by flexible leads which extend across the ends of the elements. The printing elements and leads are positioned on the upper surface of the member of the printing cartridge. In the manufacturing process, it is important that the pressure-sensitive pads are bonded to the head substrate such that the pressure-sensitive pads will not become detached from the head substrate during normal use of the device. To this end, it is known that soldering compounds can be applied to the pressure-sensitive pads after they have been formed on the
